Alkynes

Table of Contents

Summary	52
Alkynes in side chains	
Worked Examples	53
But-2-yne	
2-methylhex-2-yne	
Hept-2-en-5-yne	

Summary

Functional group	General formula	Structure/example	Prefix (Used in side chains)	Suffix (Used in parent chain)
Alkyne	-C≡C-	R——C == C—R	-ynyl	-yne

Alkynes in side chains

	ALKANE	ALKENE	ALKYNE
1 C	R Methyl	R Methenyl	
2 C	R Ethyl	R Ethenyl	R Ethynyl
3 C	R Propyl	R Propenyl	R Propynyl
4 C	R Butyl	R Butenyl	R Butynyl
5 C	R Pentyl	R Pentenyl	Pentynyl
	R	R	R
6 C	Hexyl	Hexenyl	Hexynyl

Worked Examples

But-2-yne

STEP 1: Identify the parent hydrocarbon chain

- 1.1 It should have the functional group with the highest priority¹
- 1.2 It should have the maximum length

- Functional group 🗸
- Longest chain 🗸

STEP 2: Count the number of carbons in the parent hydrocarbon chain and identify the appropriate prefix. If the parent chain is an alkane, add the -an suffix.

$$\mathbf{c}^{1} - \mathbf{c}^{2} \equiv \mathbf{c}^{3} - \mathbf{c}^{4}$$

$$4 C = BUT$$

STEP 3: Identify the functional group with the highest priority and its suffix

$$H_3C^1-C^2\equiv C^3-C^4H_3$$

ALKYNE = -YNE

STEP 4: Identify side chains. Count the number of carbons and identify their prefix and suffix

None

STEP 5: Identify any remaining functional groups (including double and triple bonds) and their suffixes

None

¹ The most recent IUPAC Blue Book release does not consider alkyne substituents when determining the parent chain. However, in this example, the new rules will not alter the nomenclature.

STEP 6: Number the parent hydrocarbon chain from the end that produces the lowest set of locants for, in order of precedence, functional groups, double and triple bonds and side chains

$$H_3C^1-C^2\equiv C^3-C^4H_3$$
 The alkyne can be considered to 'start' from carbon 2 or 3. As 2 is lower, we will use this step 7.

STEP 7: Numbers indicating the locant of the functional group are placed directly before the functional group portion of the name.

-2-YNE

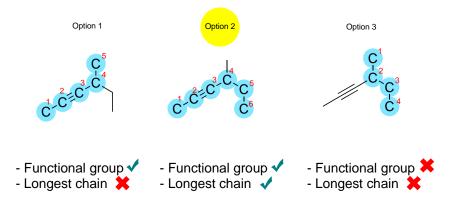

STEP 8: Write the complete name

- 8.1 Commas are written between numbers
- 8.2 Hyphens are written between numbers and letters
- 8.3 Successive words are combined into one word

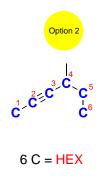

STEP 1: Identify the parent hydrocarbon chain

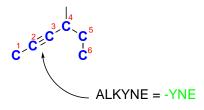

- 1.1 It should have the functional group with the highest priority²
- 1.2 It should have the maximum length

STEP 2: Count the number of carbons in the parent hydrocarbon chain and identify the appropriate prefix. If the parent chain is an alkane, add the -an suffix.

STEP 3: Identify the functional group with the highest priority and its suffix

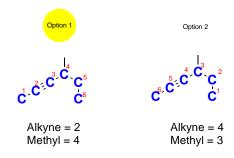

² The most recent IUPAC Blue Book release does not consider alkyne substituents when determining the parent chain. However, in this example, the new rules will not alter the nomenclature.

STEP 4: Identify side chains. Count the number of carbons and identify their prefix and suffix

STEP 5: Identify any remaining functional groups (including double and triple bonds) and their suffixes

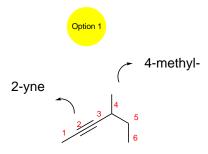

None

STEP 6: Number the parent hydrocarbon chain from the end that produces the lowest set of locants for, in order of precedence, functional groups, double and triple bonds and side chains

Lowest locants possible

STEP 7: Numbers indicating the locant of the functional group are placed directly before the functional group portion of the name.

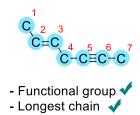

STEP 8: Write the complete name

- **8.1** Commas are written between numbers
- 8.2 Hyphens are written between numbers and letters
- 8.3 Successive words are combined into one word

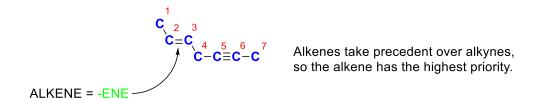

- STEP 1: Identify the parent hydrocarbon chain
 - 1.1 It should have the functional group with the highest priority³
 - **1.2** It should have the maximum length

STEP 2: Count the number of carbons in the parent hydrocarbon chain and identify the appropriate prefix. If the parent chain is an alkane, add the -an suffix.

7 C = HEPT-

STEP 3: Identify the functional group with the highest priority and its suffix

STEP 4: Identify side chains. Count the number of carbons and identify their prefix and suffix

None

³ The most recent IUPAC Blue Book release does not consider alkyne substituents when determining the parent chain. However, in this example, the new rules will not alter the nomenclature.

STEP 5: Identify any remaining functional groups (including double and triple bonds) and their suffixes

$$\mathbf{C}_{\mathbf{C}}^{1} = \mathbf{C}_{\mathbf{C}}^{4} + \mathbf{C}_{\mathbf{C}}^{5} = \mathbf{C}_{\mathbf{C}}^{6}$$

$$\mathbf{C}_{\mathbf{C}}^{4} = \mathbf{C}_{\mathbf{C}}^{6} + \mathbf{C}_{\mathbf{C}}^{7}$$

$$\mathbf{C}_{\mathbf{C}}^{4} = \mathbf{C}_{\mathbf{C}}^{6} + \mathbf{C}_{\mathbf{C}}^{7} = \mathbf{C}_{\mathbf{C}}^{7} + \mathbf{C}_{\mathbf{C}}^{7} = \mathbf{C}_{\mathbf{C}}^{7} + \mathbf{C}_{\mathbf{C}}^{7} = \mathbf{C}_{\mathbf{C}}^{7} = \mathbf{C}_{\mathbf{C}}^{7} + \mathbf{C}_{\mathbf{C}}^{7} = \mathbf{C}_{\mathbf{C}$$

STEP 6: Number the parent hydrocarbon chain from the end that produces the lowest set of locants for, in order of precedence, functional groups, double and triple bonds and side chains

Option 1

$$\begin{array}{c}
\mathbf{C}^{1} \\
\mathbf{C}^{2} = \mathbf{C}^{3} \\
\mathbf{C}^{4} = \mathbf{C} = \mathbf{C}^{7}
\end{array}$$

$$\begin{array}{c}
\mathbf{C}^{6} \\
\mathbf{C} = \mathbf{C}^{5} \\
\mathbf{C} = \mathbf{C}^{2} = \mathbf{C}^{2} = \mathbf{C}^{1}
\end{array}$$
Alkene = 2
Alkyne = 5
Alkyne = 2

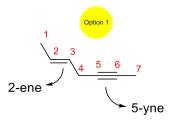

Lowest locants possible

Alkene has priority

STEP 7: Numbers indicating the locant of the functional group are placed directly before the functional group portion of the name.

7.1 Names are listed alphabetically

7.2 If there is more than one of the same functional group, the prefix di- (2), tri- (3), tetra- (4) are used. These are not considered for alphabetical listing

STEP 8: Write the complete name

- **8.1** Commas are written between numbers
- **8.2** Hyphens are written between numbers and letters
- 8.3 Successive words are combined into one word
